

ZPay: Zero-UI Payments

The future of commerce isn't a page. It's a conversation.

Commerce moved to chat. Payments got left behind.

Millions of transactions start in DMs every day. Customers find products, ask for pricing, and negotiate on WhatsApp, Instagram, and Telegram. Then it's time to pay — and the experience falls apart. The customer has to leave the chat, open a banking app, copy an account number by hand, and send a screenshot to prove they paid.

Every redirect is a chance for the customer to change their mind. Friction kills sales.

MEET TOLA

What's actually happening in her DMs right now

Tola runs *Tola's Thrift & Soles* — premium sneakers, sold entirely through Instagram and WhatsApp to 15,000 followers. Here's her Tuesday afternoon:

01

The hook

Tola posts a photo of limited-edition vintage sneakers.

02

The inquiry

A buyer named Chidi DMs: *"Love these! Do you have size 43? How much?"*

03

The close

Tola replies: *"Yes, last pair! ₦35,000."* Chidi: *"Sweet, I'll take them. How do I pay?"*

04

The friction

Tola copies her bank details into the chat and says, *"Please transfer and send me a screenshot."*

05

The drop-off

Chidi opens his banking app, gets pulled away by a notification, decides to finish it later. Later never comes.

06

The chaos

For the buyers who *do* pay, Tola's phone fills up with screenshots. She cross-references her bank app, updates a spreadsheet by hand, and guesses which payment belongs to which order.

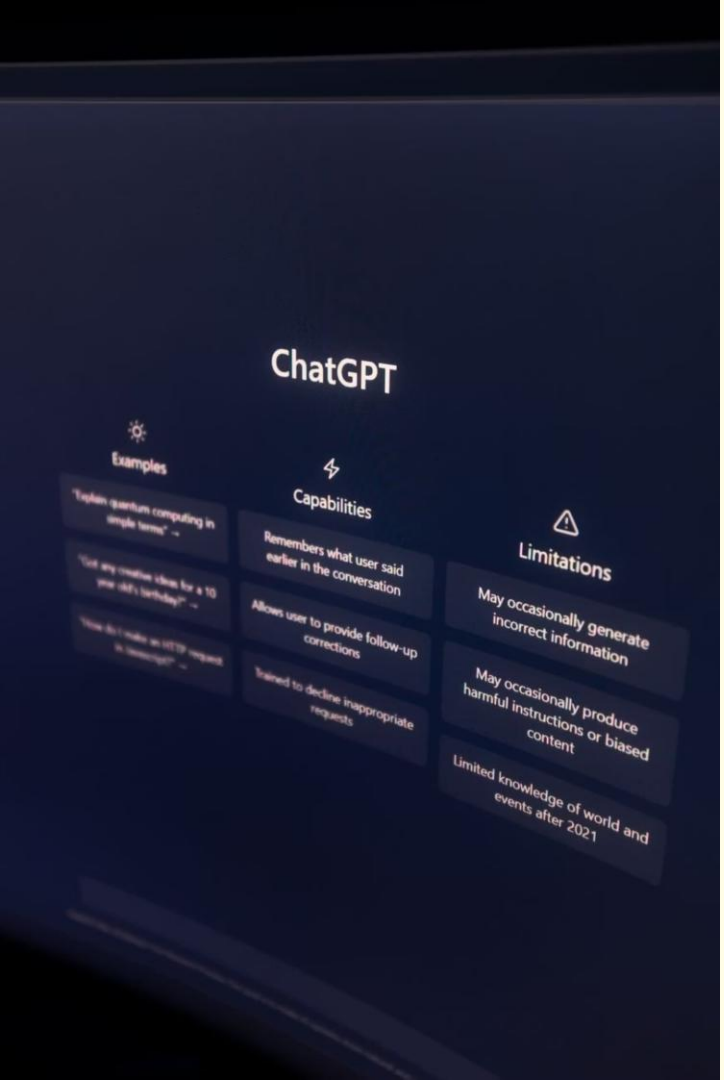

The cost: Tola loses 30% of interested buyers to payment drop-off, and spends 3 hours a day playing detective with screenshots — time she isn't spending on the next sale.

One chat. Zero redirects. Instant checkout.

ZPay embeds real, automated checkout directly into the conversation, powered by AI and **Nomba**. Here's Chidi's purchase with ZPay:

> Chidi: "I want the vintage sneakers in size 43."
>
> ZPay AI: "Perfect choice! That's ₦35,000. To confirm, transfer to this account: 🏦 Nomba Bank - 9928374829 (Or pay by card: zpay.link/tola/492)"
> [Chidi transfers — no screenshot needed]
>
> ZPay AI: "Payment confirmed! 🎉 Your order is being packed. Delivery address is still 12 Metro Way?"
> Chidi: "Yes, thanks!"

No forms. No screenshots. No leaving the chat. The customer pays while they're still excited — not after they've had time to reconsider.

ZPay bridges natural conversation and structured payment infrastructure.

Intent recognition

Parses ordinary sentences (*"I need two of the blue shirts"*, *"gimme the size L black hoodie"*) and builds the order automatically — no menus, no forms.

Nomba integration

Triggers a Nomba checkout link or a one-time virtual account the instant an order is confirmed.

Webhook confirmation

When payment lands, a webhook verifies it, sends a receipt in-chat, and updates inventory — no manual reconciliation, ever.

The Opportunity

Conversational commerce is the default, not the alternative. In markets like Nigeria, merchants build Instagram pages and WhatsApp broadcast lists before they ever build a website.

Who this is for:

Social media merchants

Instagram, TikTok, Facebook

Creator and community managers

Telegram groups, Discord servers

Group organizers

Cooperatives, school groups, event managers

We win when our merchants win.

Pay-as-you-grow

1.5% transaction fee, plus standard Nomba processing fees.

Merchant Pro

₦10,000/month flat fee with a reduced 0.5% transaction fee, for stores doing 100+ orders/month.

Why ZPay Wins

1

Zero UI.

No app to download, no interface to learn — merchants and customers both stay in the apps they already use every day.

2

Built on Nomba.

Every transaction runs on Nomba's production-grade virtual account rails, not a fragile workaround.

3

Time and sales, back.

ZPay eliminates hours of manual reconciliation and catches the sale at the exact moment the customer was ready to buy.
